

RE656: HeliPAD™ Wireless Interactive Keypad

The HeliPAD is a fully wireless, full status security keypad delivering several firsts to the security industry. The HeliPAD is **the first** touch pad to use a supervised Bluetooth Smart connection to provide two-way wireless communication with an alarm panel. It is also **the first** touchpad to use e-ink technology (similar to what is used in the Amazon Kindle) to provide real-time status updates. This low power, high contrast display ensures easy reading in high and low light conditions. The keypad itself uses capacitive touch delivering a sleek, clean finish for the customer. HeliPAD has an expected battery life of 1 year on two AAA Alkaline batteries that can be easily replaced by the customer.
